Kamagra Gel 10 mg 20 Pack

Sildenafil Citrate has revolutionized the way physicians treat men suffering from erectile dysfunction (ED). For the first time, a potent Jelly medication is available that is able to markedly improve sexual activity in over 80% of men with impotence.

How does Kamagra Oral Jelly work?

The physiologic mechanism of erection of the penis involves release of nitric oxide (NO) in the corpus cavernosum during sexual stimulation. NO then activates the enzyme guanylate cyclase which results in increased levels of cyclic guanosine monophosphate (cGMP) producing smooth muscle relaxation in the corpus cavernosum and allowing inflow of blood. Sildenafil has no direct relaxant effect on isolated human corpus cavernosum but enhances the effect of NO (Nitric oxide) by inhibiting phosphodiesterase type 5 (PDE5) which is responsible for degradation of cGMP in the corpus cavernosum. When sexual stimulation causes local release of NO, inhibition of PDE5 by Sildenafil causes increased levels of cGMP in the corpus cavernosum resulting in smooth muscle relaxation and inflow of blood to the corpus cavernosum.

How much Kamagra Oral Jelly can I take?

The maximum recommended dosing frequency of Kamagra Oral Jelly is once per day. The contents of 1 sachet of Kamagra Oral Jelly should be consumed approximately 15 - 45 minutes before sexual activity. Simply open the sachet of Kamagra Oral Jelly, squeeze the contents onto a spoon and take as you would any other liquid medication. Many people prefer just to open the sachet and squeeze the contents directly into their mouth. The choice is yours!

Who should not take Kamagra Oral Jelly?

Kamagra Oral Jelly is not for newborns or children. Do not let anyone else take your Kamagra Oral Jelly. Kamagra Oral Jelly should only be used after consultation with your doctor or healthcare advisor.

Before you start any treatment with Kamagra Oral Jelly, be sure to ask your doctor or healthcare advisor if your heart is healthy enough. If you're a man who uses nitrate drugs, like nitroglycerine, never take Kamagra Oral Jelly. The combination of Kamagra Oral Jelly and nitrates can make your blood pressure suddenly drop. Nitrates are found in many prescription medications that are used to treat angina (chest pain due to heart disease) such as:

Nitroglycerin (sprays, ointments, skin patches or pastes, and tablets that are swallowed or dissolved in the mouth)

Isosorbide mononitrate and isosorbide dinitrate (tablets that are swallowed, chewed, or dissolved in the mouth)

Nitrates are also found in recreational drugs such as amyl nitrate or nitrite (poppers)

If you are not sure if any of your medications contain nitrates, or if you do not understand what nitrates are, ask your doctor, healthcare advisor or pharmacist.

Precautions and Warnings

Kamagra Oral Jelly is not recommended for persons allergic to Sildenafil. Angina patients consuming nitrates and other anti-anginal drugs may use Sildenafil only under medical supervision and advice. Medical supervision is also required for patients who are under Cimetidine, Erythromycin, and Ketoconazole. Persons using any other MED drug must inform the physician before using Sildenafil. To be used with caution in people with liver and kidney impairment.

What are the side effects of Kamagra Oral jelly?

Like all medications, Kamagra Oral Jelly can cause some side effects. Headache, flushing, dyspepsia, dizziness, nasal congestion and blurring of vision.

These effects are normally mild in nature.
